214mdlwsetup.exe Computer Name : winnet100 Change Computer name to : winnet100 When installing Windows, you'll need to give the computer a name, so that you can easily identify and distinguish it. There are two ways you can do this. In the computer name field, type the first letter of your desired name. Windows will match the computer name with the name of the domain. Type the entire name in the computer name field. You'll need to restart your computer once the installation has completed. To confirm that you have successfully installed Windows, check the disk space remaining on the drive.The present invention relates to an information recording medium on which information such as video information, audio information and the like is recorded, an information recording and reproducing method and apparatus therefor and an information recording medium recording program and apparatus therefor, and more particularly to an information recording medium on which management information indicating defect information is recorded, an information recording and reproducing method and apparatus therefor and an information recording medium recording program and apparatus therefor. In the past, there have been proposed various kinds of information recording media in which video information and audio information are compressed and encoded, in the form of digital data, and recorded as data. Among those information recording media, an information recording medium on which video information and audio information compressed and encoded according to MPEG (Moving Picture Experts Group) standards are recorded as digital data, is used in a digital VTR (video tape recorder). MPEG audio layer 3 (MP3) is a new audio encoding standard which compresses audio data to 1/10 and records it on a CD (compact disc). In the MPEG audio layer 3, a coder part and a decoder part are arranged for each of plural audio channels. According to the MPEG audio layer 3, the audio data of one channel is divided into frames of about 10 milliseconds and the divided frames are encoded. In this case, the number of frames of one channel in one second is 20 or 40. One of the plurality of audio channels is selected as an audio channel to which one channel of audio data is assigned, and encoded data is outputted. The decoded data is time-expanded to be stored in a memory. Further, there is a method which has been proposed in order to efficiently record the data in a large-capacity memory. In this method, the data is compressed, encoded and recorded on an information recording 82157476af
